

Cal Poly Pomona, Organic Chemistry CHM 315, Dr. Laurie S. Starkey  
**Practice "Transforms" A–Z: Alcohols, Ethers and Epoxides (Answer Key)**

**A** 1) PhMgBr; 2) H<sub>3</sub>O<sup>+</sup>

**B** 1) NaH; 2) CH<sub>3</sub>CH<sub>2</sub>CH<sub>2</sub>Br  
*note: opposite disconnection  
 (1. PBr<sub>3</sub>; 2. CH<sub>3</sub>CH<sub>2</sub>CH<sub>2</sub>ONa)  
 would give E2 rather than S<sub>N</sub>2!*

**C** 1) mCPBA; 2) CH<sub>3</sub>MgBr; 3) H<sub>3</sub>O<sup>+</sup>

**D** 1) PhMgBr; 2) H<sub>3</sub>O<sup>+</sup>; 3) PBr<sub>3</sub>

**E** 1) BH<sub>3</sub>-THF; 2) H<sub>2</sub>O<sub>2</sub>, NaOH; 3) SOCl<sub>2</sub>  
*note: 3) HCl would probably rearrange, since  
 strongly acidic conditions favor carbocations.  
 Also, HCl/ROOR doesn't work - only for HBr!*

**F** 1) H<sub>2</sub>SO<sub>4</sub>, heat;  
 2) Br<sub>2</sub>

**G** 1) TsCl, pyridine; 2) NaSCH<sub>3</sub>  
*note: no E2 with weak base  
 NaSCH<sub>3</sub> (S<sub>N</sub>2 is major)*

**H** 1) NaH; 2) CH<sub>3</sub>CH<sub>2</sub>Br

**I** 1) PCC; 2) NaOH, heat  
*note: oxidize first so C=O  
 will direct elimination to give  
 stable, conjugated pi bonds.*

**J** 1) TsCl, pyridine, 2) t-BuOK  
*note: no S<sub>N</sub>2 on 3° RX, so  
 PhCH<sub>2</sub>O<sup>-</sup> + t-BuCl gives E2!*

**K** 1) CH<sub>3</sub>CH<sub>2</sub>MgBr; 2) H<sub>3</sub>O<sup>+</sup>;  
 3) SOCl<sub>2</sub> (or HCl)

**L** 1) LiAlH<sub>4</sub>; 2) H<sub>2</sub>O;  
 3) H<sub>2</sub>SO<sub>4</sub>, heat

**M** 1) TsCl, pyridine, 2) t-BuOK, heat  
*note: to get this alkene, you need E2  
 anti-elim (there is only one anti H and  
 tosylation preserves OH stereochem.);  
 dehydration gives trisubstituted alkene*

**N** 1) Mg; 2) CH<sub>3</sub>CHO;  
 3) H<sub>3</sub>O<sup>+</sup>

**O** 1) BH<sub>3</sub>-THF  
 2) H<sub>2</sub>O<sub>2</sub>, NaOH  
 3) PCC

**P** 1) NaH; 2) CH<sub>3</sub>I

**Q** 1) Mg; 2) CH<sub>3</sub>CH<sub>2</sub>CHO; 3) H<sub>3</sub>O<sup>+</sup>

**R** 1) H<sub>2</sub>SO<sub>4</sub>, heat; 2) mCPBA

**S** CH<sub>3</sub>OH, H<sub>2</sub>SO<sub>4</sub>

**T** 1) H<sub>3</sub>O<sup>+</sup>; 2) NaH; 3) CH<sub>3</sub>I  
*better hydration than H<sub>3</sub>O<sup>+</sup>:  
 1) Hg(OAc)<sub>2</sub>; 2) NaBH<sub>4</sub>  
 note: 1) HBr; 2) CH<sub>3</sub>ONa gives E2*

**U** 1) H<sub>2</sub>, Lindlar's cat; 2) CH<sub>3</sub>CO<sub>3</sub>H, H<sub>2</sub>O  
 or 1) Na, NH<sub>3</sub>; 2) OsO<sub>4</sub>  
*note: We're adding two H's and two OH's.  
 To achieve desired stereochemistry, we need  
 to add one syn and the other anti  
 (H<sub>2</sub>, Lindlar's; OsO<sub>4</sub> gives wrong product).*

**V** 1) H<sub>2</sub>SO<sub>4</sub>, heat; 2) H<sub>2</sub>, Pd  
 or 1) TsCl, pyridine; 2) LiAlH<sub>4</sub>

**W** 1) NaOH; 2) PCC

**X** 1) H<sub>2</sub>SO<sub>4</sub>, heat; 2) HBr, ROOR

**Y** 1) BH<sub>3</sub>-THF; 2) H<sub>2</sub>O<sub>2</sub>, NaOH; 3) NaH; 4) CH<sub>3</sub>CH<sub>2</sub>Br  
 or 1) HBr, ROOR; 2) CH<sub>3</sub>CH<sub>2</sub>ONa

**Z** 1) PBr<sub>3</sub>; 2) Mg  
*note: 1) HBr would probably rearrange!*
